

# *community* structure

introduction to *network analysis* (*ina*)

Lovro Šubelj  
University of Ljubljana  
spring 2024/25

## community *structure*

karate club *network split* [Zac77]

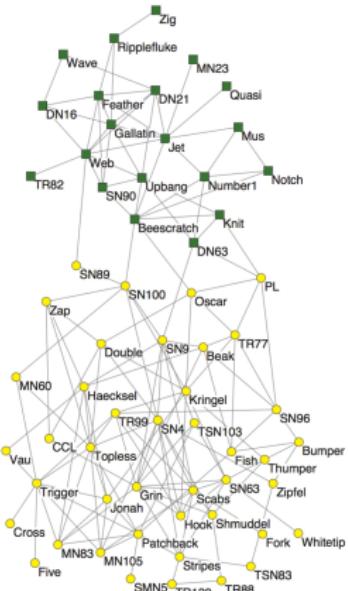

## community *detection*

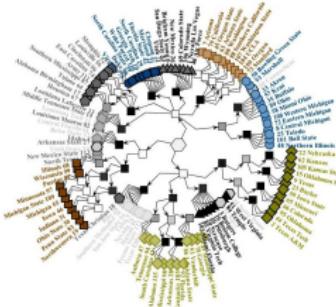

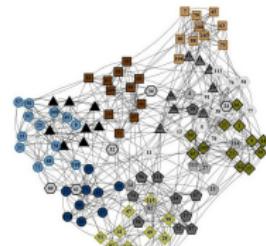

karate club *split detection* [RAK07]

# community *examples*

*most social networks* contain *communities* [GN02]

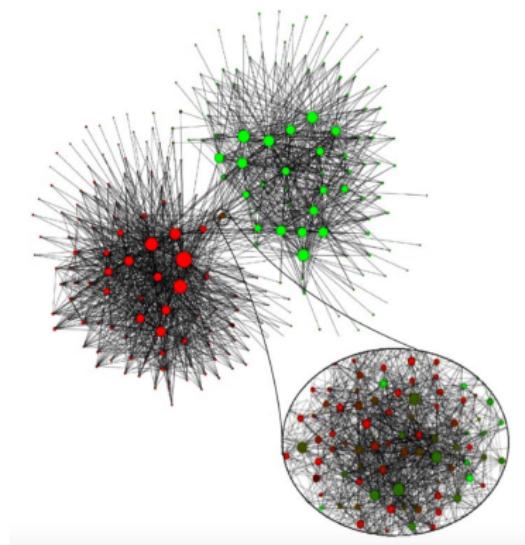

bottlenose dolphins [LSB<sup>+</sup>03]

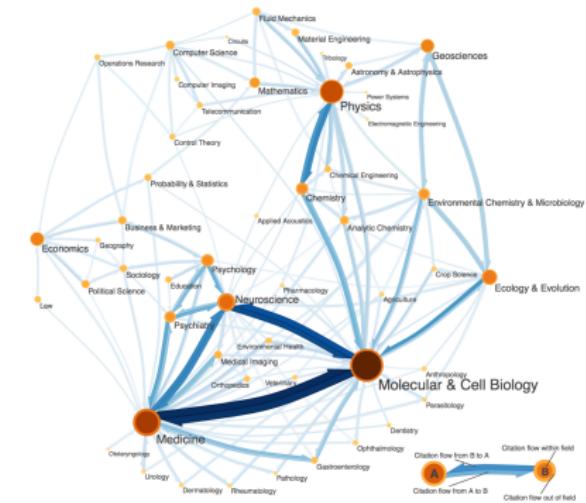

american football [GN02]

# community *examples*

many *information networks* contain *communities* [FLG00]

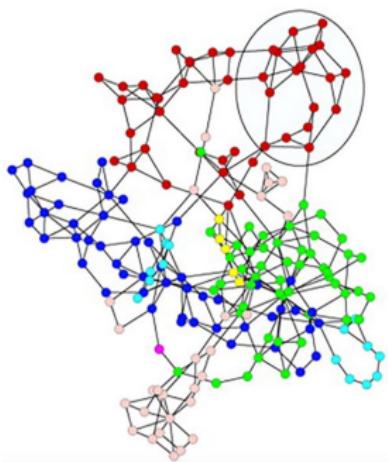

mobile communications [BGLL08]

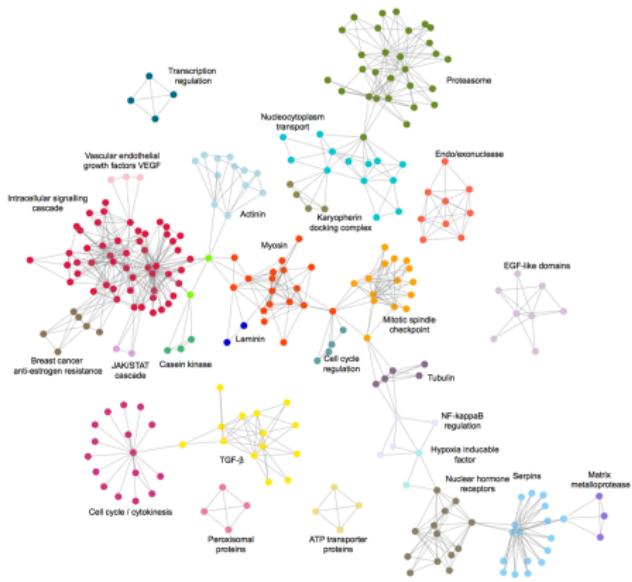

journal citations [RB08]

# community *examples*

*many biological networks* contain *communities* [RSM<sup>+</sup>02]

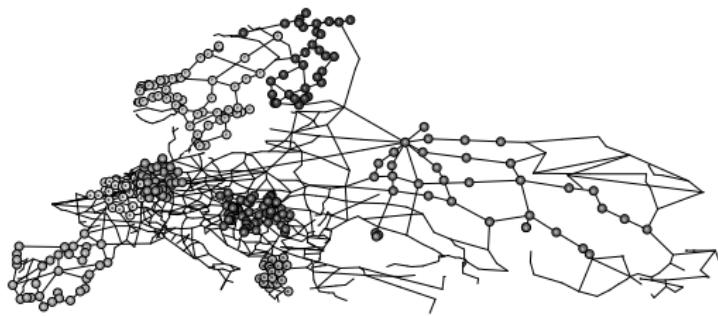

*E. coli* metabolism [RSM<sup>+</sup>02]

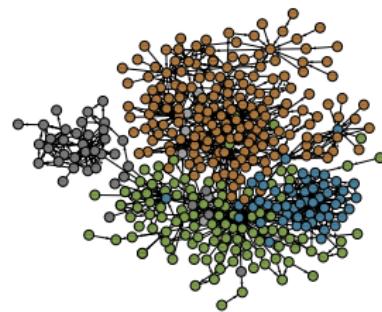

protein interactions [JCZB06]

## community *examples*

*technological networks* rarely contain *communities* [ŠB11a]

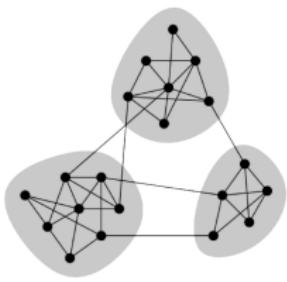

European highways [ŠB11b]

JUNG dependencies [ŠB11a]

## community *explanation*

- *weak & strong ties* according to *information flow*
- *bridges & embedded ties* according to *network span*
  - removal of *local bridge*  $\{i,j\}$  causes  $d_{ij} > 2$
  - removal of *bridge*  $\{i,j\}$  causes  $d_{ij} = \infty$
  - *embedded tie*  $\{i,j\}$  has  $C_{ij} > 0$

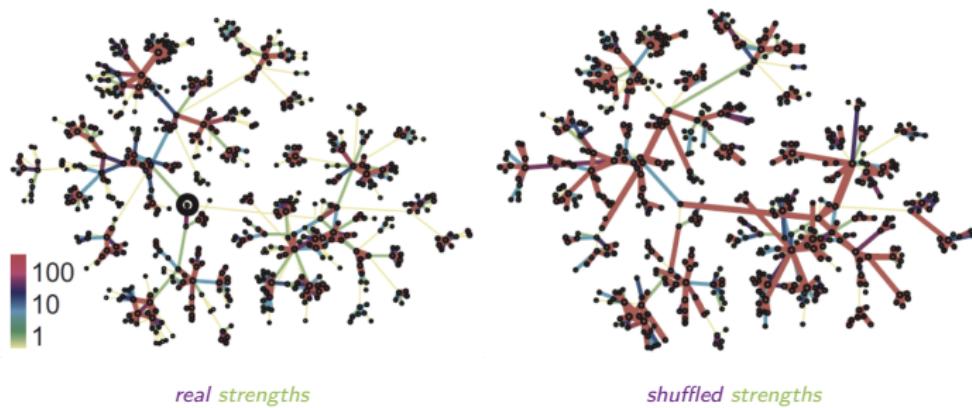

strength of weak ties or weakness of strong ties

- *weak ties are (local) bridges under triadic closure* [Gra73]
- *assortative mixing* and *homophily* in (social) networks [NG03]

## community *experiment*

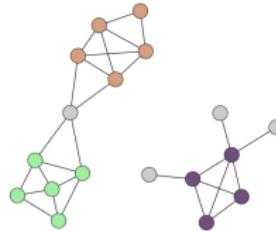

- *tie strength* in mobile communications [OSH<sup>+</sup>07]
- *weak ties are (local) bridges* in real networks

strength of weak ties or weakness of strong ties

# community *definition*

- *clique* is *complete subgraph of some graph*
  - also *k-plexes*, *k-cores*, *k-cliques*, *k-clubs*, *k-clans*
- *community* is *dense subgraph of sparse network* [GN02]
- *strong* and *weak community*  $C$  [FLG00, RCC<sup>+</sup>04] defined as
  - $k_i^{\text{int}}$  and  $k_i^{\text{ext}}$  are *internal* and *external degree* of  $i$
$$\forall i \in C : k_i^{\text{int}} > k_i^{\text{ext}} \quad \sum_{i \in C} k_i^{\text{int}} > \sum_{i \in C} k_i^{\text{ext}}$$
- *community detection* is  $\gg$  *graph partitioning* [For10]

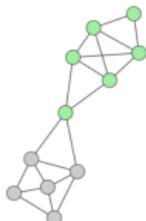

*connected communities*

*maximum clique*

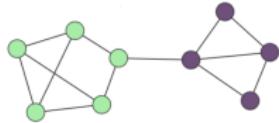

*strong community*

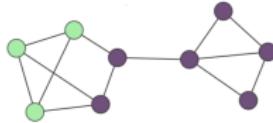

*weak community*

# community *modularity*

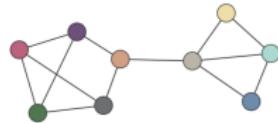

- random graphs should lack community structure
- modularity  $Q$  [GN02] of communities  $\{C\}$  defined as
  - $k_c = \sum_{i \in C} k_i$  is total degree and  $m_c$  is number of links in  $C$
$$\frac{1}{2m} \sum_{ij} \left( A_{ij} - \frac{k_i k_j}{2m} \right) \delta_{c_i c_j} = \frac{1}{2m} \sum_C \sum_{ij \in C} \left( A_{ij} - \frac{k_i k_j}{2m} \right) = \sum_C \frac{m_c}{m} - \left( \frac{k_c}{2m} \right)^2$$
$$Q = \frac{1}{2m} \sum_{ij} \left( A_{ij} - \frac{k_i k_j}{2m} \right) \delta_{c_i c_j} = \sum_C \frac{m_c}{m} - \left( \frac{k_c}{2m} \right)^2$$
- modularity  $Q$  popular quality/optimization function [For10]

optimal  $Q = 0.41$

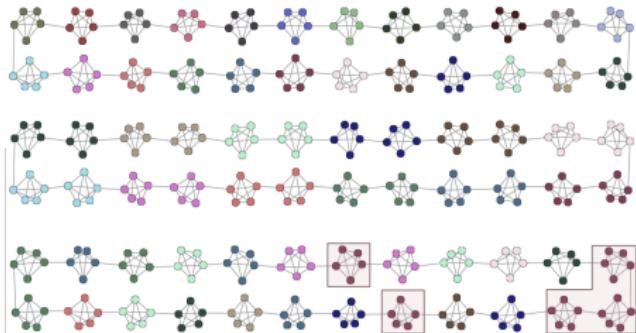

suboptimal  $Q = 0.22$

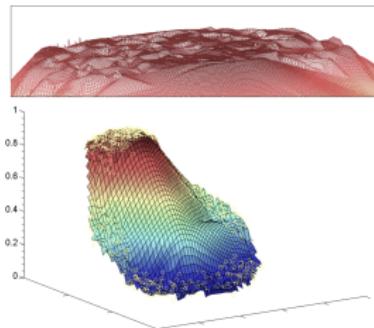

isolates  $Q = -0.12$

# community $\neg$ modularity

- modularity  $Q \gg 0$  also in random graphs [GSPA04]
- modularity  $Q$  has resolution limit at  $k_c \leq \sqrt{2m}$  [FB07]
- modularity  $Q$  lacks clear optimum in real networks [GdMC10]

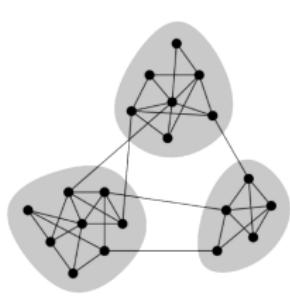

intuitive  $Q = 0.867$ , optimal  $Q = 0.871$  and random  $Q = 0.8$

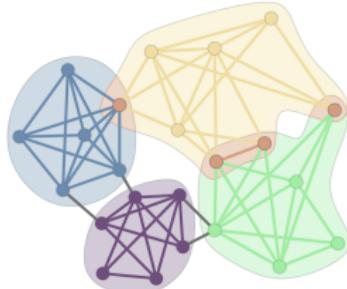

$Q$  plateau and maxima

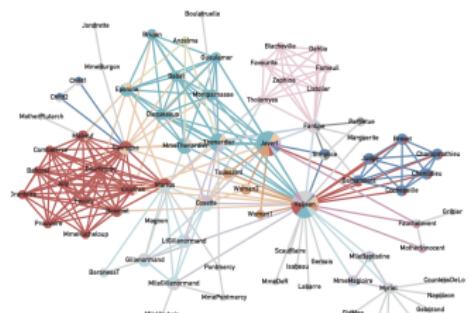

# community *overview*

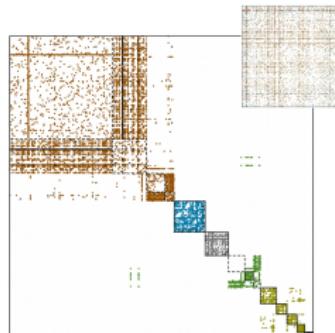

communities [GN02]

overlapping communities [PDFV05]

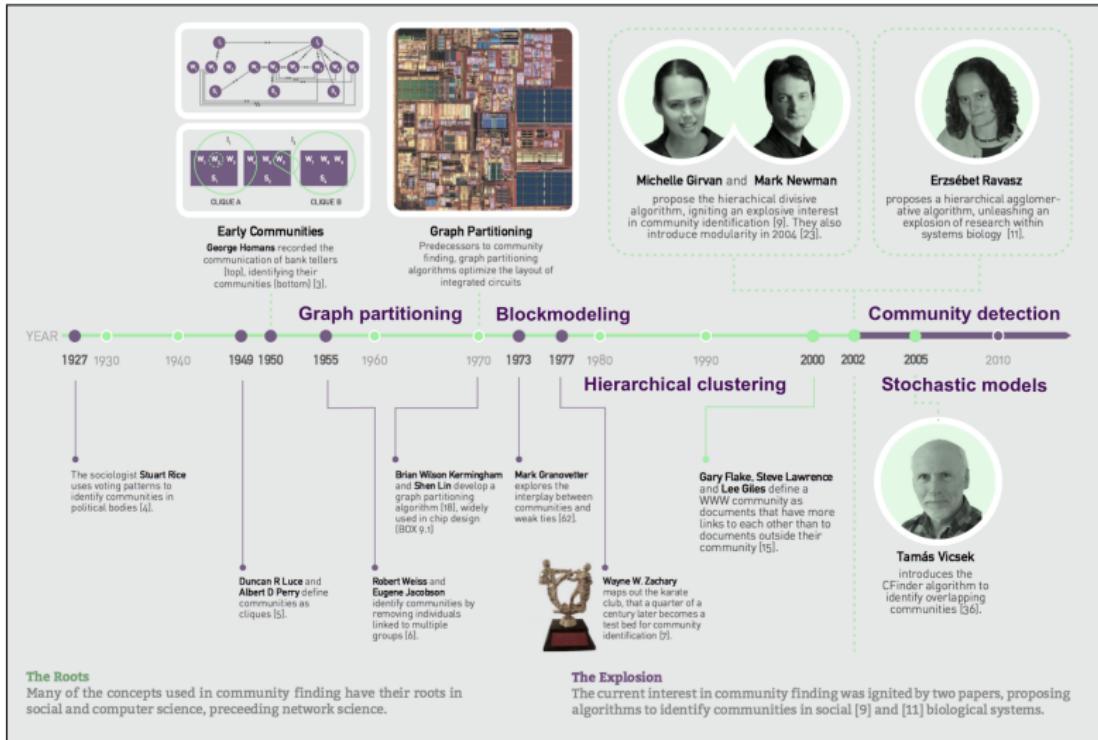

link communities [EL09, ABL10]

block models, blockmodeling etc.

`javax.swing, javax.management, javax.xml, javax.print, javax.naming, javax.lang`
